Part 1: The Puzzle

Solving the 25% Client No-Show Problem for a Wellness Practice

Kayro Assignment

THE PROBLEM

One in four clients (25%) fails to show up for booked consultations, and the nutritionist only discovers the absence while waiting in the clinic. Because she operates entirely via WhatsApp and an Excel spreadsheet, there is no automated reminder loop, no advance confirmation trigger, and no visibility into attendee intent.

Most no-shows stem from two human factors: **simple forgetfulness** (busy routines) or **changing plans combined with social friction** (clients feel uncomfortable texting to cancel, so they silently ghost). The solution must proactively remind clients, eliminate the emotional hesitation of rescheduling, and give the nutritionist early warning.

1. Booking
Instant WhatsApp confirmation + Calendar invite
→
2. T − 24h Check
1-tap "I'll be there" or 1-tap "Reschedule"
→
3. T − 2h Ping
Directions, clinic link & final prompt
→
4. Triage Radar
Unconfirmed slots freed for waitlist

WHAT I WOULD DO

1. Automated WhatsApp Reminders (Timing: T − 24 Hours and T − 2 Hours)

The practice already uses WhatsApp (>90% open rates). Send an automated notification 24 hours prior and 2 hours prior with exact date, time, and consultation details. *Why: Directly solves simple forgetfulness.*

2. Frictionless 1-Tap Confirmation ("I'll Be There")

Rather than requiring open-ended typing, include a single button: "I'll be there" (or reply YES). Once tapped, the slot turns verified on her dashboard. *Why: Psychological commitment (consistency principle). If unconfirmed by evening before, she knows in advance, not in the room.*

3. Zero-Awkwardness Rescheduling Link

Every message includes a 1-click self-serve link: "*Plans changed? Tap to pick a new time.*" *Why: People skip when moving a visit feels confrontational. Frictionless self-service immediately frees the slot for someone else.*

4. Nutritionist "Unconfirmed Radar"

A triage list on her dashboard highlighting tomorrow's unconfirmed clients. She can send a 1-tap WhatsApp prompt or backfill the opening with waitlisted clients. *Why: Maximizes clinic utilization and preserves billable hours.*

5. Targeted Deposit Policy for Repeat Offenders Only

Track attendance history. If a client records two consecutive unnotified no-shows, require a modest booking advance for future sessions that credits toward their bill. *Why: Targets the root problem without adding friction for reliable clients.*

WHERE I WOULD START

I would immediately roll out **Steps 1 through 4** because they cost nothing, require no payment gateway, and respect the existing WhatsApp habit. I would track the no-show rate for 30 days. If it remains high, I would activate Step 5.

In the prototype app: I built this operational logic directly into Part 2 with a client "*I'll be there*" confirmation button, a nutritionist 1-tap *WhatsApp reminder link*, and a real-time *No-show rate KPI*.
