Kayro Deliverable 5

SESSION 1: OPERATIONAL PROBLEM FRAMING (PART 1)

USER PROMPT:

I'm working on an assignment for a wellness clinic. A nutritionist runs consultations using WhatsApp and Excel, but 1 in 4 clients (25%) simply don't show up. She only finds out when sitting there waiting. How should I solve this for her? Give me practical steps that don't require heavy engineering or immediate payment friction, and explain why each step works. No code.

AI RESPONSE:

Suggested a 5-step operational framework: (1) Automated WhatsApp Reminders (T-24h & T-2h); (2) Active 1-tap confirmation ("I'll be there" / YES); (3) Frictionless self-service rescheduling link in every notification; (4) Unconfirmed client triage list for the nutritionist; (5) Targeted deposit policy for repeat offenders. Recommended rolling out 1–4 first (zero cost, zero payment friction) and tracking no-shows for 30 days before activating step 5.

USER CLARIFICATION:

I want to tie this strategy directly into Part 2 (the prototype build). What features should the prototype have to reflect this strategy?

AI RESPONSE:

Embed Part 1 mitigations directly into the UI: (1) "I'll be there" confirmation button on client home; (2) "✓ Client confirmed" status tag on the nutritionist dashboard; (3) 1-click "Remind on WhatsApp" pre-filled message generator; (4) Real-time No-show rate KPI card.

SESSION 2: ARCHITECTURE & INITIAL BUILD (PART 2)

USER PROMPT:

Build a single-file prototype (`index.html`) with two views sharing the same data: Side A (Client app, mobile-first, next visit, booking with no double booking, upcoming/past lists, reschedule/cancel) and Side B (Nutritionist dashboard, colored status badges Booked/Done/No-show with inline updates, manual add form, Today filter). Load with the sample data from the brief.

AI RESPONSE:

Provided initial vanilla HTML/CSS/JS single-page architecture using CSS custom properties for theming and `localStorage` for persistence.

SESSION 3: TESTING, BOUNDARY BUGS & CRITICAL FIXES

USER CORRECTION 1 (Sample Data Normalization):

The sample data has 3 date styles (`24/10/2026` , `2026-10-24` , `25-10-2026`) and 4 time notations (`10:00` , `11:30am` , `4 pm` , `14:00`). Your parser failed on "4 pm" and didn't unify Riya's two visits. Fix the regex parsers.

AI RESPONSE:

Updated `nDate` and `nTime` with comprehensive regex parsers normalizing all dates to `YYYY-MM-DD` and times to 24h `HH:mm` . Normalized phone numbers to 10 digits to match client records.

USER CORRECTION 2 (Rescheduling Bug for Phone-less Clients):
When testing Meera Iyer's appointment (who has no phone), rescheduling throws an un-fixable validation error: "*Enter a valid 10-digit phone number*". But in reschedule mode, the phone input is hidden! Fix this.

AI RESPONSE:
Identified root cause: `go()` was enforcing phone validation on existing records. Updated `go()` so existing appointments retain their prior phone value without blocking phone-less rescheduling.

USER CORRECTION 3 (Evaluator Date Time-Warp):
Because sample data is dated October 2026, opening the app today marks all sample appointments as "past". The client home shows "No visit planned" and Today filter is empty! An evaluator opening the hosted link will see a blank state. Fix this.

AI RESPONSE:
Implemented a **Demo Date Context** anchored by default to `2026-10-24`. Riya's consultation immediately appears on the home screen, Today's clinic shows 2 appointments, and WhatsApp buttons are active. Added a 1-click toggle to switch to live device time.

USER CORRECTION 4 (Cross-Tab Sync & Reset Utility):
Add cross-tab reactive sync and a sample data reset button for reviewers.

AI RESPONSE:
Added `window.storage` event listener for cross-tab sync, and added a `↺ Reset Sample Data` action.
